Records your mouse movements as you work through a text editor. Records your mouse movements as you work through a text editor. Note: This tool is now an alternative to the classic X recorder and has been improved in many ways. It's a freeware utility and all the usual disclaimers apply. XMouseRecorder is a Windows software application that enables you to record mouse movements as you work through a text editor. As you perform text editing actions, XMouseRecorder will note down your mouse movements. Then you can paste your mouse movements into an e-mail or a chat and use it as a visual reference.

XMouseRecorder is the ideal solution for tracking things down. For example, you may need to identify a particular line that contains a bug. Now you can do this while looking at a recorded screen and XMouseRecorder will mark the relevant line on the screen where your mouse was located when you were editing. You may also want to create a paste of the text you're editing.

XMouseRecorder makes it easy to capture all the text on screen and paste it to another location in the document.

XMouseRecorder also has many other nifty features that will allow you to track anything else you want on your screen. Like a user control feature that allows you to move a user control such as a check box or list box, a "flash controls" feature that is useful for quick scrolling through controls, a drag and drop recorder and a frame recorder. XMouseRecorder is a very simple utility but it does a great job of recording your mouse moves as you edit. This utility has been around for a while and seems to be well liked so it is unlikely it will be updated any time soon. The only caveat to this utility is that it is a 32-bit application so you may need to install an XP/Vista/7 compatibility layer if you try to run the software on a newer operating system.
